RDFShape User Manual

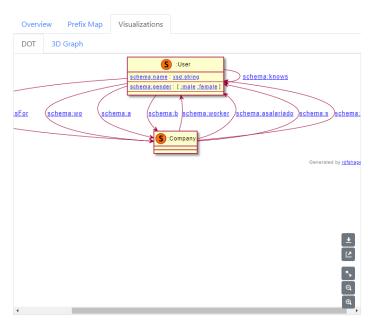

RDFShape is a compendium of semantic web tools, including a visualisation of Shape Expressions. The tool is accessible at:

https://rdfshape.weso.es/shexInfo

To generate a visualisation of a ShEx schema, enter it in the text area and, without changing the format, click on "Analyze".

If there are no problems, a series of tabs will appear on the right hand side. Click on "Visualizations"; the default active option (DOT) is the one required for this test.

For convenience, you can open the visualisation in a separate tab or open it in full screen.

Visual notation

Shapes are represented by boxes, with their name at the top. The constraints and qualifiers concerning that shape are shown as textual statements at the bottom.

The only exception are references to other shapes, which are shown as arrows pointing to the target shape. Thus, the following scheme:

```
:User CLOSED {
    schema:name xsd:string;
    schema:gender [:male :female];
    schema:knows @:User;
}
```

Is represented as follows:
